

## Gold remains indispensable – despite short-term corrections

Pretoria, May 30, 2025 – The gold price is currently moving within a field of tension between conflicting market forces. While the price recently fell to around USD 3,290 per ounce, the precious metal remains highly relevant in the long term.

Technical resistance and geopolitical developments are influencing short-term movements, but institutional investors continue to rely on gold as a stable anchor in uncertain times.

### Technical hurdles slow the market but not permanently

The downward trendline at around USD 3,340 currently acts as a psychological resistance. A sustained breakout above this level could trigger a new upward movement. However, analysts see no fundamental trend reversal even if the price falls back to USD 3,116.

*On the contrary – such corrections are part of every healthy market development.*

Additionally, the recent easing in the trade conflict between the USA and China has led to a decline in “safe haven” demand. Markets responded positively to diplomatic signals, which temporarily weighed on the gold price. A strong US dollar and interest rate speculation also had a dampening effect.

### Silent shift towards safety

At the same time, analysts are observing a massive, silent shift behind the scenes:

Large funds, pension schemes and central banks – especially in China, India and Turkey – are continuing to increase their gold reserves. The world’s largest gold ETF has also recently recorded strong inflows. This development clearly shows: *institutional investors remain loyal to gold, regardless of its daily price.*

### Bitcoin as a competitor? Only on the surface

At the same time, Bitcoin is gaining significance as an alternative store of value. In recent weeks, over USD 9 billion have flowed into Bitcoin ETFs, while gold funds have seen capital outflows. This shows a growing diversification of security strategies – but it does not diminish the strategic role of physical gold.

Because one thing remains clear: *gold is not a speculative object, but a proven hedge against systemic risks, inflation, and geopolitical uncertainties.*

*Unlike digital assets, gold has intrinsic value, is globally recognized, and is independent of technological infrastructure or political control.*

Short-term price declines do not change its fundamental importance.

On the contrary: they offer smart investors the opportunity to build positions at more attractive entry points.

### Conclusion: Stability instead of speculation

Amid economic upheaval and volatile markets, gold remains an indispensable anchor of stability. For long-term-oriented investors and institutional players such as SRT-Tech, one thing is certain:

**Gold is more than just a precious metal – it is a strategic security instrument with lasting value.**
